

# **DESCRIPTION OF COMPUTER NETWORK USING GEOSPATIAL**

Summary – The article is devoted to practical use of complex data types that describe the vector geometry and they are available on MS SQL Server platform. Showing the main features of these objects and object selection methods that support them. Two applications were presented describing the local networks of varying coverage, which allowed the use of both types: geometry and geography. Data visualization has been ensured with the use of both your own application and commercial reporting tool.
