

## **FUNCTION RESULT CACHE - PL/SQL PERFORMANCE IMPROVEMENT**

Summary - This paper presents a novel idea of using Function Result Cache together with Virtual Private Database (VPD) to optimize performance of data retrieval from Oracle database. The Oracle VPD defines default table access policies which transparently for users restrict data on table WHERE clause level. Such functionality implies additional restrictions to caching functionality, what can be overlooked by PL/SQL developers. Reading this paper give you important instructions how to avoid such issues.
