APPLICATION OF SPATIAL DATA TO DESCRIBE THE SURFACE ELEMENTS USING MS SQL SERVER 2008

Summary – The main topic of the article is to create a system that supports the search process of flat objects on a map, and the input of such objects and the server-side database storage. For this purpose built complex Spatial types together with their methods have been used. In the application tier uses the .NET development environment and Google Maps as a graphical presentation of results and data entry.
